

Epochs '26 – Assignment 8 is Live!

It's time to take your Machine Learning model to the next level!  

In this challenge, you'll revisit the **Customer Churn Prediction** problem and focus on improving your model through optimization. Compare your optimized model with a baseline, analyze its performance, and understand what drives customer churn.

 **Dataset:** Customer Churn Dataset

 <https://www.kaggle.com/datasets/muhammadshahidazeem/customer-churn-dataset>

What You'll Do

- ♦ Build a baseline classification model.
- ♦ Optimize your model using suitable techniques.
- ♦ Compare the baseline and optimized models using appropriate evaluation metrics.
- ♦ Analyze the model to identify the key factors influencing customer churn.
- ♦ Summarize your findings and provide recommendations based on your analysis.

Submission

Your GitHub repository should contain:

 **model_optimization.ipynb**

- Complete implementation of the challenge

 **README.md**

- A concise summary of your project
- Your optimization approach
- Important observations and findings
- Model improvements
- Final conclusions

Note: Please include your **Name** and **MUID** at the top of your **README.md**.

Submit your repository link in **#epochs-submissions** using the tag:

#evn-ds-epochs26-day08

 **Reward:** 250 Karma Points

 **Deadline:** Within **48 hours** after the completion of the **Day 9** session.
